

@tug.ca  
(we got mail!)

BTW, a well marketed iSeries will make the remainder of the industry go under. To use IBM's own words, "I' can do it."

**Subject:** Application code wanted!

Vaughn,  
If possible, please print this in the TUG eServer magazine... We at the Toronto Lab are looking for some real-life application code that someone (some companies?) would be willing to give us for playing/testing purposes. We here in Toronto do not own any real-life application code of our own. We will sign a confidentiality agreement to ensure that we will only be using this code inside the lab for our own purposes.... but we are desperately looking for some 5250 green screen application code ... that we can put through WebFacing ... or WebSphere Studio testing, etc. I was thinking that we might also be able to put this request on your TUG WebSite and see if anyone is interested in helping us out??

Thanks,  
Alison Butterill  
Certified IT Specialist - Application Development and iSeries Technical Advocate, IBM Toronto Development Lab

Marketing the name eServer is IBM's plan, but from my perspective, this is a crock of (you know what). There are two kinds of computers in the world, iSeries and inferior computers. If brain-dead IBM wants to keep this fact a secret, then sell the division, and I will get up a team of people that will make this platform take off.

Anne,  
With all due respect, the example of ads that were shown in the presentation that you are I saw at NES on the evening of 3/26 showed the words "iSeries" in what was virtually "fine print". Although this might be what IBM wants, from my perspective, this is totally unacceptable.
