

Your people move around the floor. So do your printers. **Can you see it?**

## IBM Wireless Printing

Locate your printers closer to the people who use them. The farther industrial printers are from the job, the greater the likelihood of error. Labels get mixed up. Shipments get delayed. Or they end up being shipped to the wrong customers. *In fact, printing problems are often the hidden cause of everything from supply chain problems to charge-backs, from customer complaints to idle workers.* All of which can add up to lost revenue. Why are you hearing about this from IBM? We've been offering printing solutions for over 40 years. And now we're applying our experience to wireless.

### IBM 4400 Thermal Printer Family

Designed for total flexibility of location and application in industrial environments, the 4400 works with a wireless Ethernet attachment card and can fit on a power cart for greater mobility. It's powered Printer Management Utility (PMU) software for remote access, configuration, and diagnostics. And the 4400 allows for wired or wireless operation.

### IBM 6400 Line Matrix Family

The 6400 is built for demanding, high-volume industrial printing environments. It prints up to 2000 lines per minute<sup>3</sup> depending on the model. It has full graphic and bar code features. And it automatically employs rigorous quality controls. Powered by Printer Management Utility (PMU), it can provide both wired and wireless operation when configured with the wireless Ethernet option. Plus it's designed to lower your total cost of printing.
